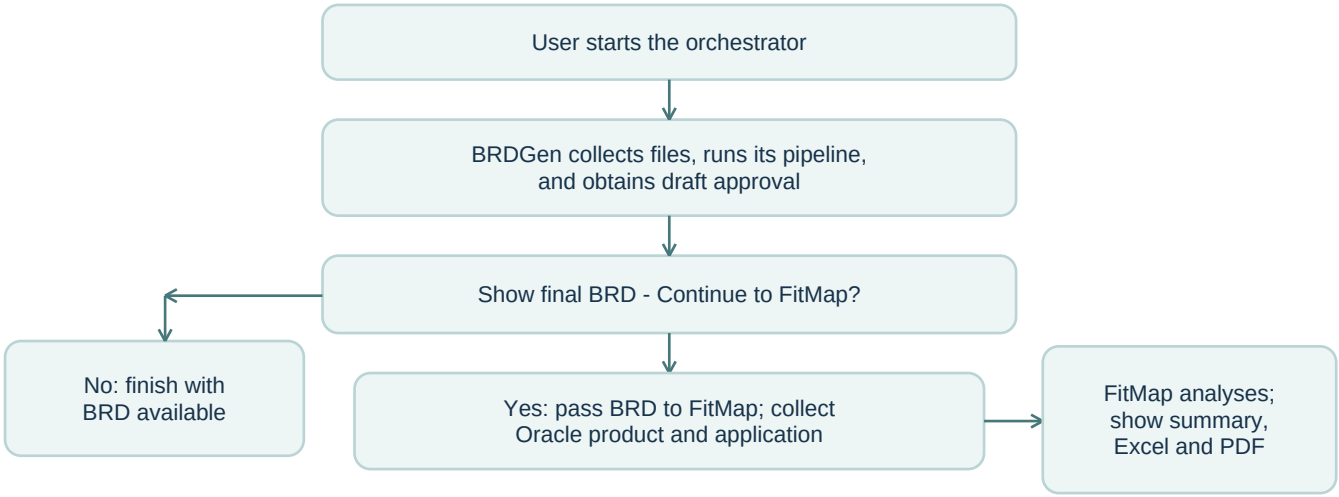
BRDGen + FitMap Conversational Orchestrator

Objective

Create a new Aetherion conversational agent that connects BRDGen and FitMap in one conversation. It automatically passes BRDGen's final document to FitMap after the user agrees to continue.

Neither existing agent will be modified. Their processing logic, input forms, and review steps will be reused.

Proposed flow



One conversation; existing agent workflows reused

All questions and results appear in the same conversation. The user does not need to download and re-upload the BRD.

Architecture

The orchestrator contains three small components:

Component	Responsibility
Conversation instructions	Explain the service and recognize when the user wants to start.
Workflow controller	Manage BRDGen -> user decision -> FitMap, and retain progress and results.
Platform connector	Invoke the existing agents through Aetherion, route their interactions to the conversation, and retrieve results.

BRDGen continues to generate requirements. FitMap continues to perform analysis. The orchestrator only coordinates their execution.

File handoff

The orchestrator takes the final requirements document's `file_key` from BRDGen's `outputs` and supplies it as FitMap's `brd_file`.

- Prefer **Excel**, which preserves requirement IDs and process columns.
- Support **Word** when selected by the user.
- Pass only the requirements document, not the accompanying masking ZIP.
- Reuse the stored file; do not regenerate, convert, or re-upload it.

FitMap's existing forms collect the Oracle product and application, so the orchestrator does not duplicate those questions.

Implementation phases

Phase	Work	Expected outcome
1. Create the conversational agent	Create a separate project and register it using Aetherion's @agent and @register, with chat_enabled=True and hitl_enabled=True. Define conversation instructions and input/output schemas.	A conversational entry point for the combined process.
2. Connect BRDGen	Invoke BRDGen with available inputs. Let its existing workflow handle missing uploads, validation, and draft approval. Capture its final result.	Users complete the existing BRD process through the orchestrator.
3. Add the decision and handoff	Show the BRD and ask, "Would you like to continue with FitGap analysis?" On Yes, pass its saved document reference to FitMap. On No, finish with the BRD available.	Automatic transfer controlled by explicit user consent.
4. Connect FitMap and deliver results	Let FitMap collect Oracle selections and execute its existing pipeline. Display its summary and Excel/PDF reports.	The complete process runs in one conversation.
5. Add recovery, test, and publish	Handle cancellation, timeout, failures, and retries. Test the complete flow in the sandbox, then publish the new agent.	Reliable orchestration with both existing agents unchanged.

Edge cases and recovery

Save the current stage, run IDs, document reference, user decision, and results. Validate the following scenarios during testing:

Edge case	Planned handling
BRDGen fails or review is cancelled	Stop; do not start FitMap.
BRDGen returns a partial result	Show its warning before requesting consent to continue.
User selects No or does not respond within 24 hours	Finish with the BRD available.
Repeated Yes or execution restart	Use saved run IDs and unique request keys to prevent duplicate runs.
Multiple outputs or missing/inaccessible file	Select only the BRD document, never the ZIP; stop if its reference is unusable.
FitMap fails	Retain the BRD and allow an explicit FitMap-only retry.
Reply to an old or incorrect question	Match replies to the active run and question before proceeding.

Acceptance criteria

- One conversation throughout, including existing input and review forms.
- No manual file transfer between agents.
- FitMap starts only after explicit user agreement.
- BRD and final reports remain accessible.
- Retries do not unnecessarily repeat completed work.
- No changes to either existing agent and no duplication of their processing logic.
